

MONITOR CONTROL MEASURES AND VERIFY PERFORMANCE

SSP Manual Pages 77 to 84

SANITATION SAFETY PLANNING

MODULE 5: MONITOR CONTROL MEASURES AND VERIFY PERFORMANCE

SSP Modules

MODULE 5: MONITOR CONTROL MEASURES AND VERIFY PERFORMANCE

MODULE 5

Overview

STEPS

5.1 Define and implement operational monitoring.

5.2 Verify system performance.

5.3 Audit the system.

OUTPUTS

- An operational monitoring plan.
- A verification monitoring plan.

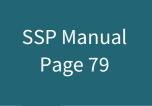

OBJECTIVE

To give simple and rapid feedback on system performance, so that corrections can be made quickly, if required.

Operational Monitoring

Routine monitoring to inform management decisions.

- Frequent.
- Many monitoring points throughout the system.
- Simple observations and tests.
- Used to manage risks before they occur.
- Implemented by service provides.

STEP 5.1 Define and implement operational monitoring

Examples of possible monitoring parameters:

Transport and

conveyance

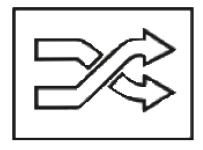

• Use of PPE by sanitation workers

- Use of the pre-defined roads
- Cleanliness of sewers

Data collected from customers, formal and informal operators and, where relevant, licensing authorities or regulatory bodies.

Data collected from operators and verified by occasional sampling and independent laboratory analysis.

Treatment

Retention times

Composting temperatures

Keep in mind...

May not be practical to monitor all control measures.

Decide which control measures need to have operational monitoring (prioritize based on risk assessment).

Critical limits help decide acceptability:

- usually, **numerical limits** based on a parameter measurement.
- **qualitative limits** may be appropriate (e.g. "all odours to be acceptable" or "flies not a nuisance").

STEP 5.1 Define and implement operational monitoring

Suggested recording format

TOOL 5.2. Template for operational monitoring							
	OPERATIONAL MONITORING PLAN						
Operational monitoring plan for: (Give control measure short description)							
Operational limitsª	Operational monitoring of the control measure		Corrective action when the operational limit is exceeded				
	What is monitored?		What action is to be				
	How is it monitored?		taken?				
	Where is it monitored?		Who takes the action?				
	Who monitors it?		When is it taken?				
	When is it monitored?		Who needs to be informed of the action?				

^a If the monitoring is outside this limit(s), the control measure is deemed to be not functioning as intended.

Worked example: SSP IN NEWTOWN

Operational m	nonitoring plan for: Trainin	plan for: Training of vacuum truck operators about health and safety				
Operational limits	Operational monitoring measure	of the control	Corrective action when the operational limit is exceeded			
100% (Workers are required to	What is monitored?	Frequency of PPE use by workers	What action is to be	Policy involves a fee to be paid to City Service "Traffic law enforcement and licences".		
	How is it monitored?	Surprise visits to the field and observation	taken?			
use personal protective equipment	Where is it monitored?	At the household and roads	Who takes the action?	Traffic policy officer		
[PPE] at all times)	Who monitors it?	Traffic policy officer	When is it taken?	Every time		
	When is it monitored?	Constantly	Who needs to be informed of the action?	Regional Health Department		

OBJECTIVE

To periodically verify whether the system meets the intended performance outcomes.

Verification

It checks the effectiveness of the implemented control measures.

- Periodic.
- Few points, but focused on the system-end points (quality of the effluents).
- More complicated tests (e.g. E.coli, Helminth eggs).
- Used to prove the system works.
- Might be undertaken by the operator or surveillance agencies.

STEP 5.2

Verify system performance

Toilet

Examples of **typical verification data**

Use of toilet facilities (decrease of open defecation)

- Containment- | storage/treatment
 - Pathogen concentration in groundwater
 nt

Conveyance

• Amount of faecal sludge transported to the faecal treatment system.

• Microbial testing of effluents, e.g. E.coli and Helminth eggs.

- End use/ disposal
- Microbial testing of crops, fish products, and waters at exposure points and system boundaries, e.g. E.coli and Helminth eggs.

Operational vs. Verification Monitoring Let's see some examples:

Hazardous event: Ingestion of pathogens while using dirty shared toilets because of lack of cleaning and maintenance.

Control measure: Outsourcing a private business to clean and maintain the shared facilities.

Monitoring parameter: Daily cleaning of the facilities, using an attendance sheet signed by the janitor.

Verification parameter: Cleanliness of the toilet, using sanitary inspections.

Operational vs. Verification Monitoring Let's see some examples:

Hazardous event: Ingestion after contact with faecal sludge discharged without treatment to the open.

Control measure: Licensing private operators and training them to bring the faecal sludge to a legal discharging point.

Monitoring parameter: Number of licensed and trained operators.

Verification parameter: Number of operators bringing the sludge to the legal discharging point.

Photo by López Vázquez et al.

Operational vs. Verification Monitoring

Let's see some examples:

Hazardous event: Consumption of contaminated agricultural products grown with faecal sludge **Control measure:** Co-composting of de-watered faecal sludge with organic solid waste

Monitoring parameter: Temperature reached in co-composting piles

Verification parameter:

Parasitic helminth eggs (HELarval/gTS) Pathogen indicator of faecal Coliforms (MPN/g TS)

OBJECTIVE

To provide additional independent evidence of the system performance and quality of the SSP.

Audits:

- Might not be feasible in the initial stages of SSP implementation.
- Check the quality and effectiveness of the SSP implementation.
- Ensure that the SSP contribute to health outcomes.
- Can be done by internal, regulatory or independent auditors.
- Demonstrate that the sanitation safety plan has been properly designed, is being implemented correctly and is effective.

Worked example: SSP IN NEWTOWN

Sanitation step	Verification						
	What	Limit	When	Who	Method		
P2: Disposal of liquid fraction by infiltration	<i>E. coli</i> testing in drinking-water	No detectible <i>E. coli/</i> 100 mL	Annual	Epidemiologist, Sanitola School of Public Health	Sampling and testing		
P4: Disposal of faecal sludge in open drains	Amount of faecal sludge transported to the WWTP	>50 m3/day	Every week	WWTP Operations Manager	Survey		
T2: Open drains	Number of new connections to the sewer system	>500/year	Annual	Head, Commercial Unit, NSD	Annual reports		
T2: Open drains	Number of overflows per year	<3 overflows	Annual	Engineering Section, NSD	Annual reports		
P6: Use of wastewater in agriculture	Farmer health status: % of farmers and family member with helminth infections	<10%	Annual	Regional Health Department	Annual survey		
P6: Use of wastewater in agriculture	Microbial concentration of pathogens at harvest	No worm eggs or <i>E. coli/</i> gram in vegetables	Annual	Epidemiologist, Sanitola School of Public Health	Sampling and testing		

GROUP WORK

Applying Module 5 to our Alwar SSP

- Select 3 control measures that should have an operational monitoring plan.
- Prepare a monitoring plan for each of them.

Operational monitoring plan					
Operational monitoring plan for:					
Operational limits	Operational monitoring of the control measure: Control measure:		Corrective action when the operational limit is exceeded		
	What is monitored?		What action is to be taken?		
	How is it monitored?				
	Where is it monitored?		Who takes the action?		
	Who monitors it?		When is it taken?		
	When is it monitored?		Who needs to be informed of the action?		

Prepare a verification plan

	What is the objective of implementing this control measure?	How would you measure it?	Verification				
What is the control measure?			What indicator will you use?	What is the maximum value you will accept?	When are you going to measure it?	who will	How will it be measured?

MONITOR CONTROL MEASURES AND VERIFY PERFORMANCE
